

Abstract (150-250 words)

- Background and Motivation
- Replication Objectives
- Extension Objectives
- Methods and Data
- Key findings
- Conclusion and Implications

1 Introduction

- **Objective of the Study:** State that this is a replication study and describe the original paper's research question.
- **Motivation:** Explain why the replication is important (e.g., verification, robustness check, policy relevance).
- **Original Paper's Key Contributions:** Summarize the main claims of the original study.
- **Your Contribution:**
 - **Replication:** What aspects of the paper you are reproducing.
 - **Extension:** What additional analysis you conduct and why.
- **Structure of the Paper:** Brief overview of upcoming sections.

2 Literature Review

- **Original Paper in Context:** Discuss the original study's place in the literature.
- **Related Work:** Highlight other papers on the topic.
- **Positioning of Your Study:** Explain how your replication and extension contribute to the literature.

3 Replication Study Design

- **Replication Scope:** Clearly state what aspects of the original paper you are replicating (e.g., main tables, robustness checks).
- **Data & Sample:** Describe whether you use the original dataset or a reconstructed dataset.
- **Empirical Approach:** Explain whether you follow the original methodology exactly or make modifications due to data limitations.
- **Expectations:** State whether you anticipate matching the original results and why.
- **Potential Issues:** Discuss any data limitations or biases and how they are addressed.

4 Replication Results

- **Main Findings:** Present the results of your replication exercise.
- **Comparison to Original Study:**
 - Do your estimates match the original paper's?
 - If not, discuss potential reasons (e.g., different data cleaning steps, missing information).
- **Robustness Checks:** Test whether small changes (e.g., different functional forms, subsamples) affect the results.

5 Results

- **Motivation for Extension:** Justify why your additional analysis is valuable (e.g., testing a new hypothesis, updating data, alternative econometric method).
- **New Research Question(s):** State how your extension builds on the original work.
- **Data and Methods for Extension:**
 - If new data is used, describe it.
 - If new methods are applied, justify them.

- **Results of Extended Analysis:** Present findings, compare them to the original paper, and interpret their implications.
- **Robustness Checks:** Assess whether the extended findings hold under alternative specifications.

6 Discussion and Implications

- **What Was Learned from the Replication:** Assess whether the original study's findings hold.
- **Interpretation of Extended Analysis:** How does your additional analysis deepen understanding of the topic?
- **Limitations:** Acknowledge any constraints in your study.
- **Policy or Research Implications:** If relevant, discuss practical implications.

7 Conclusion

- **Summary of Key Takeaways:**
 - Were the original results replicable?
 - What insights did the extension provide?
- **Final Thoughts: Future research directions or unanswered questions.**
